

Programming Guidelines

In this section the programming guidelines are to be described.

- Each programming project should be version controlled. You can use svn, git,....
- Try to follow the PEP8 rules as close as possible. Read the PEP8 document before you start coding on the project.
- Make use of the doc string utility within Python. Write clearly what the purpose is of a class as well as for functions and methods. Functions and method also should have a description of their input arguments and their returns.
- Write some test case for each module.
